IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the

application.

1. (Original) A method for identifying potential noise failures in an integrated

circuit design comprising:

locating a victim net and an aggressor within the integrated circuit design;

modeling the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits,

including determining a coupling between the victim net and the aggressor; and

indicating that the integrated circuit design requires modification if modeling

the victim net indicates that a potential noise failure may occur in the integrated

circuit design.

2. (Original) The method defined in Claim 1 wherein modeling the victim net

using two  $\pi$ -type resistor-capacitor (RC) circuits comprises modeling the victim net

with one  $\pi$ -type RC circuit before a coupling location and one  $\pi$ -type RC circuit after

the coupling location.

3. (Original) The method defined in Claim 1 wherein modeling the victim net

comprises determining noise width.

4. (Currently Amended) The method defined in Claim 3 wherein the noise

2

width is determined corresponding to:

Application No. 09/823,085

Amdt. dated October 1, 2004

Reply to Office action of July 1, 2004

Atty. Docket no. 04120.P005

$$t_{v} \ln \left[ \frac{\left(t_{x} - t_{r} v_{t}\right) \left(e^{t_{r}/t_{v}} - 1\right)}{t_{r} v_{t}} \right]$$

where  $t_r$  comprises transition time,  $t_v$  comprises distributed Elmore delay of the victim net,  $t_x$  comprises the RC delay term from the upstream resistance of the coupling elements multiplied by the coupling capacitance, and  $v_t$  comprises a threshold voltage.

- 5. (Original) The method defined in Claim 4 wherein the threshold voltage is set to half of the peak noise voltage.
- 6. (Currently Amended) The method defined in Claim 3 A method for identifying potential noise failures in an integrated circuit design comprising:

  locating a victim net and an aggressor within the integrated circuit design; modeling the victim net using two π-type resistor-capacitor (RC) circuits, including determining a coupling between the victim net and the aggressor and determining noise width, wherein the noise width is determined corresponding to:

$$t_r + t_v \ln \left[ \frac{1 - e^{-2t_r/t_v}}{1 - e^{-t_r/t_v}} \right]$$

where  $t_r$  comprises transition time and  $t_v$  comprises a distributed Elemore delays of the victim net; and

indicating that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

7. (Currently Amended) The method defined in Claim 3 A method for identifying potential noise failures in an integrated circuit design comprising:
locating a victim net and an aggressor within the integrated circuit design;
modeling the victim net using two π-type resistor-capacitor (RC) circuits,
including determining a coupling between the victim net and the aggressor and determining noise width, wherein the noise width is based on only transition time and distributed Elmore delay of the victim net; and

indicating that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

8. (Currently Amended) The method defined in Claim 3 A method for identifying potential noise failures in an integrated circuit design comprising:

locating a victim net and an aggressor within the integrated circuit design;
modeling the victim net using two π-type resistor-capacitor (RC) circuits,
including determining a coupling between the victim net and the aggressor and determining noise width, wherein the noise width is independent of an RC delay term from upstream resistance of the coupling element times coupling capacitance of the coupling location; and

indicating that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

- 9. (Original) The method defined in Claim 1 wherein modeling the victim net comprises determining the peak noise amplitude.
- 10. (Currently Amended) The method defined in Claim 9 wherein the peak noise amplitude is determined according to:

$$\frac{(R_d + R_s)C_x}{R_d(C_1 + C_x + C_2 + C_L) + R_s(C_x + C_2 + C_L) + R_eC_L}$$

where R<sub>d</sub> comprises the effective resistance of the victim driver, R<sub>s</sub> comprises the upstream wire resistance from the victim driver to the coupling center, R<sub>e</sub> is the downstream wire resistance from the coupling center to the receiver under noise consideration, C<sub>x</sub> is the coupling capacitance, C<sub>1</sub> is half of the upstream wiring capacitance from the coupling center to the driver, C<sub>2</sub> is half of the total wire capacitance on the path from the driver to the receiver, and C<sub>L</sub> is half of the total wire capacitance from the coupling center to the receiver, plus the receiver input capacitance.

11. (Original) The method defined in Claim 1 wherein modeling the victim net comprises computing crosstalk noise at a sink with a lumped capacitance at each branch incorporated on a path from a source to the sink, with lumped capacitances being added in a weighted manner based on their locations on the path.

12. (Original) An article of manufacture comprising one or more recordable medium having executable instructions stored thereon which, when executed by a system, cause the system to:

locate a victim net and an aggressor within the integrated circuit design; model the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits, including determining a coupling between the victim net and the aggressor; and indicate that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

- 13. (Original) The article of manufacture defined in Claim 12 further comprising instructions to model the victim net with one  $\pi$ -type RC circuit before a coupling location and one  $\pi$ -type RC circuit after the coupling location.
- 14. (Original) The article of manufacture defined in Claim 12 wherein instructions to model the victim net comprise instructions to determine noise width.
- 15. (Currently Amended) The article of manufacture defined in Claim 14 wherein the noise width is determined corresponding to:

$$t_{v} \ln \left[ \frac{\left(t_{x} - t_{r} v_{t}\right) \left(e^{t_{r}/t_{v}} - 1\right)}{t_{r} v_{t}} \right]$$

where t<sub>r</sub> comprises transition time, t<sub>v</sub> comprises distributed Elmore delay of the victim net, t<sub>x</sub> comprises the RC delay term from the upstream resistance of the coupling

elements multiplied by the coupling capacitance, and  $v_t$  comprises a threshold voltage.

- 16. (Original) The article of manufacture defined in Claim 15 wherein the threshold voltage is set to half of the peak noise voltage.
- 17. (Currently Amended) The article of manufacture defined in Claim 14

  An article of manufacture comprising one or more recordable medium having executable instructions stored thereon which, when executed by a system, cause the system to:

locate a victim net and an aggressor within the integrated circuit design; model the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits, including determining a coupling between the victim net and the aggressor and instructions to determine noise width, wherein the noise width is determined corresponding to:

$$t_r + t_v \ln \left[ \frac{1 - e^{-2t_r/t_v}}{1 - e^{-t_r/t_v}} \right]$$

where  $t_r$  comprises transition time and  $t_\nu$  comprises a distributed Elemore delays of the victim net; and

indicate that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

18. (Currently Amended) The article of manufacture defined in Claim 14

An article of manufacture comprising one or more recordable medium having executable instructions stored thereon which, when executed by a system, cause the system to:

locate a victim net and an aggressor within the integrated circuit design; model the victim net using two π-type resistor-capacitor (RC) circuits, including determining a coupling between the victim net and the aggressor and instructions to determine noise width, wherein the noise width is based on only transition time and distributed Elmore delay of the victim net; and

indicate that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

19. (Currently Amended) The article of manufacture defined in Claim 14

An article of manufacture comprising one or more recordable medium having

executable instructions stored thereon which, when executed by a system, cause the system to:

locate a victim net and an aggressor within the integrated circuit design;
model the victim net using two π-type resistor-capacitor (RC) circuits,
including determining a coupling between the victim net and the aggressor and
instructions to determine noise width, wherein the noise width is independent of an
RC delay term from upstream resistance of the coupling element times coupling
capacitance of the coupling location; and

indicate that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

- 20. (Original) The article of manufacture defined in Claim 12 wherein instructions to model the victim net comprise instructions to determine the peak noise amplitude.
- 21. (Currently Amended) The article of manufacture defined in Claim 20 wherein the peak noise amplitude is determined according to:

$$\frac{(R_d + R_s)C_x}{R_d(C_1 + C_x + C_2 + C_L) + R_s(C_x + C_2 + C_L) + R_eC_L}$$

where  $R_d$  comprises the effective resistance of the victim driver,  $R_s$  comprises the upstream wire resistance from the victim driver to the coupling center,  $R_e$  is the downstream wire resistance from the coupling center to the receiver under noise consideration,  $C_x$  is the coupling capacitance,  $C_1$  is half of the upstream wiring capacitance from the coupling center to the driver,  $C_2$  is half of the total wire capacitance on the path from the driver to the receiver, and  $C_L$  is half of the total wire capacitance from the coupling center to the receiver, plus the receiver input capacitance.

22. (Original) The article of manufacture defined in Claim 12 wherein instructions to model the victim net comprise instructions to compute crosstalk noise

at a sink with a lumped capacitance at each branch incorporated on a path from a

source to the sink, with lumped capacitances being added in a weighted manner

based on their locations on the path.

23. (Original) An apparatus for identifying potential noise failures in an

integrated circuit design comprising:

means for locating a victim net and an aggressor within the integrated circuit

design;

means for modeling the victim net using two  $\pi$ -type resistor-capacitor (RC)

circuits, including means for determining a coupling between the victim net and the

aggressor; and

means for indicating that the integrated circuit design requires modification if

modeling the victim net indicates that a potential noise failure may occur in the

integrated circuit design.

24. (Original) The apparatus defined in Claim 23 wherein the means for

modeling the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits comprises

means for modeling the victim net with one  $\pi$ -type RC circuit before a coupling

location and one  $\pi$ -type RC circuit after the coupling location.

25. (Original) The apparatus defined in Claim 23 wherein the means for

10

modeling the victim net comprises means for determining noise width.

Application No. 09/823,085

Amdt. dated October 1, 2004

Reply to Office action of July 1, 2004

Atty. Docket no. 04120.P005

26. (Currently Amended) The apparatus defined in Claim 25 wherein the noise width is determined corresponding to:

$$t_{v} \ln \left[ \frac{\left(t_{x} - t_{r} v_{t}\right) \left(e^{t_{r}/t_{v}} - 1\right)}{t_{r} v_{t}} \right]$$

where  $t_r$  comprises transition time,  $t_v$  comprises distributed Elmore delay of the victim net,  $t_x$  comprises the RC delay term from the upstream resistance of the coupling elements multiplied by the coupling capacitance, and  $v_t$  comprises a threshold voltage.

- 27. (Original) The apparatus defined in Claim 26 wherein the threshold voltage is set to half of the peak noise voltage.
- 28. (Currently Amended) The apparatus defined in Claim 25 An apparatus for identifying potential noise failures in an integrated circuit design comprising:

  means for locating a victim net and an aggressor within the integrated circuit

design;

means for modeling the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits, including means for determining a coupling between the victim net and the aggressor and means for determining noise width, wherein the noise width is determined corresponding to:

$$t_r + t_v \ln \left[ \frac{1 - e^{-2t_r/t_v}}{1 - e^{-t_r/t_v}} \right]$$

where t<sub>r</sub> comprises transition time and t<sub>v</sub> comprises a distributed Elemore delays of the victim net; and

means for indicating that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

29. (Currently Amended) The apparatus defined in Claim 25 An apparatus

for identifying potential noise failures in an integrated circuit design comprising:

means for locating a victim net and an aggressor within the integrated circuit

design;

means for modeling the victim net using two  $\pi$ -type resistor-capacitor (RC)

circuits, including means for determining a coupling between the victim net and the

aggressor and means for determining noise width, wherein the noise width is based

on only transition time and distributed Elmore delay of the victim net; and

means for indicating that the integrated circuit design requires modification if

modeling the victim net indicates that a potential noise failure may occur in the

integrated circuit design.

30. (Currently Amended) The apparatus defined in Claim 25 An apparatus

for identifying potential noise failures in an integrated circuit design comprising:

means for locating a victim net and an aggressor within the integrated circuit

design;

Application No. 09/823,085 Amdt. dated October 1, 2004 Reply to Office action of July 1, 2004 Atty. Docket no. 04120.P005

means for modeling the victim net using two  $\pi$ -type resistor-capacitor (RC) circuits, including means for determining a coupling between the victim net and the aggressor and means for determining noise width, wherein the noise width is independent of an RC delay term from upstream resistance of the coupling element times coupling capacitance of the coupling location; and

means for indicating that the integrated circuit design requires modification if modeling the victim net indicates that a potential noise failure may occur in the integrated circuit design.

- 31. (Original) The apparatus defined in Claim 23 wherein the means for modeling the victim net comprises means for determining the peak noise amplitude.
- 32. (Currently Amended) The apparatus defined in Claim 31 wherein the peak noise amplitude is determined according to:

$$\frac{(R_d + R_s)C_x}{R_d(C_1 + C_x + C_2 + C_L) + R_s(C_x + C_2 + C_L) + R_eC_L}$$

where  $R_d$  comprises the effective resistance of the victim driver,  $R_s$  comprises the upstream wire resistance from the victim driver to the coupling center,  $R_e$  is the downstream wire resistance from the coupling center to the receiver under noise consideration,  $C_x$  is the coupling capacitance,  $C_1$  is half of the upstream wiring capacitance from the coupling center to the driver,  $C_2$  is half of the total wire capacitance on the path from the driver to the receiver, and  $C_L$  is half of the total

wire capacitance from the coupling center to the receiver, plus the receiver input capacitance.

33. (Original) The apparatus defined in Claim 23 wherein the means for modeling the victim net comprises computing crosstalk noise at a sink with a lumped capacitance at each branch incorporated on a path from a source to the sink, with lumped capacitances being added in a weighted manner based on their locations on the path.
